

Endorsed by the leading security installation companies

APS systems are installed, operated and maintained by the country's leading security companies. In order to maintain their reputations and operate profitably, they need to work with the best available technology. Their endorsement of APS Technology systems is a reliable indicator of the quality of our products.

Training and back-up

Just as installers rely on us to provide high quality products, we rely on their skills to maintain the reputation of our equipment. Our extensive training programme is designed to ensure the reliability of APS Technology, because a well - installed system is an efficient system, with low maintenance costs and extended operating life.

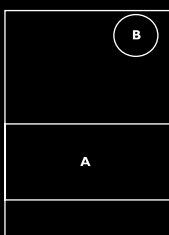

Your investment is also protected by the upgradability built in to every APS system, allowing you to modify your security as technology develops and your needs change. And whenever you need operating advice or technical back up, APS customer support service is here to help.

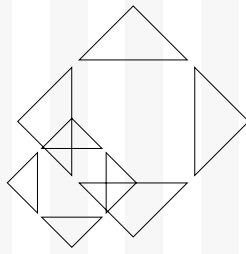

Internationally recognised

As you read this brochure, APS Technology is actively protecting a wide range of commercial, public and government premises in the UK, and worldwide, including:

Manufacturing facilities, computer installations, factories, warehouses, banks and building societies, museums, water purification plants, power stations, electricity sub-stations, gasometers, shipping containers and military installations.

- A – Secure access point featuring electric fencing to the perimeter entrance gate
- B – Electrified protection of an entire petroleum pipeline

Strength in diversity

It's night time.

It's raining.

There's no moon.

And something's moving out there.

It could be a bunch of kids or a professional criminal; it could be a stray dog. Without the benefit of a truly sophisticated security system, you're in the dark.

But with Advanced Perimeter Systems Ltd. (APS) Technology, you can have your eyes and ears everywhere: on fences, and buildings; on vehicles and containers; in warehouses, offices and computer rooms.

Our systems are suitable for all kinds of commercial and public applications. They are installed and operated by the biggest names in the security industry, and used to protect banks and building societies, factories and warehouses, power stations, airport perimeters, museums, schools, government buildings and military installations. Anywhere, in fact, where they're serious about security.

You know your security staff can't be everywhere at once. With APS Technology, they don't need to be.

Town centre security

Shopping malls

Building security management

Prisons and remand centres

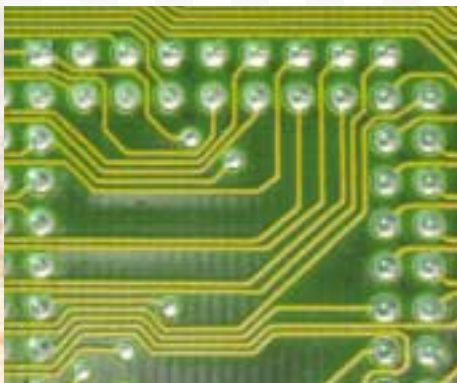

Hospitals and clinics

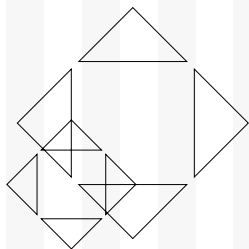

Schools and colleges

Mental health units

Military installations

Commercial complexes

Bespoke flexible security

Flexible and cost effective

Our intelligent security systems are built on outstanding technical expertise, and constant updating keeps them at the leading edge of technology. Designed and manufactured in Scotland by APS Ltd, a company formed in the early 1980s and specialising in high technology security products.

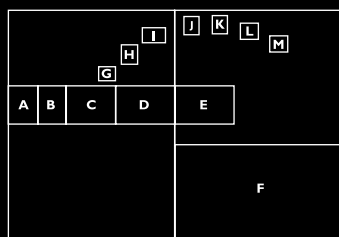

The APS systems can be controlled on-site or remotely, with audio and video links. APS has also developed a wide range of specialist products to protect everything from works of art to industrial and commercial complexes.

Once installed, high quality components ensure your system will be cost effective to operate with low maintenance costs. It's designed to be expandable and upgradable.

Security? Tell us all about it

It's not our job to convince you that you need a better security system. But we can help you to select the right one.

We're prepared to invest our time and expertise in helping you devise a technically advanced, cost effective system; and since this customisation process contributes to our product development programme, it won't cost you a penny extra. APS prices are market prices.

- A – Stand alone electric fencing
- B – Warehouse security
- C – Car supermarket electrified fencing
- D – Perimeter security fencing
- E – Pallsade electric fencing
- F – Air field perimeter security fencing
- G – Megasyms computer assisted surveillance

- H – EF- Energiser
- I – 20 way controller
- J – FS 310
- K – FS 300
- L – WS 110
- M – WS 100

End user bespoke systems

Every security situation is different. Unfortunately, some manufacturers rely on a handful of standard products to cover any number of applications, with predictable results. APS Technology is different because each installation is individually designed, using state of the art technology. And every component - hardware and software - can be modified if the job requires it. APS Technology means end user bespoke systems. We simply don't make any other kind.

Man or mouse?

The efficiency of your security system depends a lot on intelligent analysis and response.

It's vital to pick up every unauthorised intrusion, but it's also important not to call out keyholders or the police every time the wind blows a branch against your face. Nuisance alarms cost time and money, and genuine alerts may not get taken seriously.

With APS Technology you get the right level of security appropriate to your situation – maximising protection but minimising nuisance alarms.

When an alarm is signalled, security staff need to assess the threat, APS Technology can accommodate microphones or video for remote verification.
